

Agnos Candidate Assignment

Each candidate must complete the assignment within 3 days of receiving the task.

Front-end developer:

Task:

Develop a responsive, real-time patient input form and staff view system. The project consists of two main interfaces:

- **Patient Form:** A responsive form where patients can enter their information.
- **Staff View:** A real-time, responsive interface for staff members to monitor the information being entered in the patient form.

The two interfaces should synchronize in real-time, reflecting patient input immediately on the staff view. This should be implemented using the specified tech stack and deployed on a frontend cloud platform.

Requirements:

- Patient Form:
 - Create a form that allows patients to input their personal details, including:
 - First Name
 - Middle Name (optional)
 - Last Name
 - Date of Birth
 - Gender
 - Phone Number
 - Email
 - Address
 - Preferred Language
 - Nationality
 - Emergency Contact (optional: name and relationship)
 - Religion (optional)
 - Include form validation (e.g., required fields, valid phone number, email if applicable).
 - Responsive design that functions well on mobile and desktop devices.
- Staff View:
 - Display each field from the patient form in real-time as the patient inputs or updates information.

- Provide a responsive design for staff members, adapting to various screen sizes.
- Display indicators to show if the patient has submitted, is actively filling in, or is inactive in the form.
- **Real-Time Synchronization:**
 - Use WebSockets or any suitable real-time technology to synchronize data between the patient and staff views instantly.

Tech Stack:

- **Framework:** Next.js
- **Styling:** TailwindCSS
- **Real-Time Communication:** WebSockets or any suitable solution
- **Hosting:** Deploy on a platform such as Vercel, Heroku, or Netlify.

Deliverables:

- **Code Repository:** Link to a GitHub (or similar) repository with clear instructions for running the project.
- **Deployed Application:** Live link to the deployed project.
- **Readme File:** Include a README with an overview of the project, any setup instructions, and descriptions of any bonus features implemented.
- **Development Planning documentation:**
 - **Project Structure:** Explanation of the folder/file structure.
 - **Design :** design decisions made for UI/UX in different screen size.
 - **Component Architecture:** Description of main components and their purposes.
 - **Real-Time Synchronization Flow:** Summary of how real-time updates are handled and synchronized.

Evaluation Criteria:

- **Responsiveness:** The design should adapt well to both mobile and desktop layouts.
- **Code Quality:** Clean, organized code following modern JavaScript and React/Next.js best practices.
- **Functionality:** Meets all listed requirements and effectively synchronizes real-time data.
- **UX/UI:** A simple, intuitive design that provides a smooth experience for both patient and staff users.
- **Deployment:** Properly deployed on a frontend cloud platform with an accessible URL.
